In 2003, Autodesk purchased the Bluebeam Corporation, the developer of the popular rival desktop-based CAD program, MicroStation. The company also created the Total-Lab mobile app in 2012, which is a competitor to AutoCAD. Today, AutoCAD is still one of the most powerful and most commonly used applications on the market. The software is used worldwide, with over 35,000 firms based in over 200 countries using it to design, document, and create detailed drawings and documentation for many industrial, commercial, and government sectors including aerospace, construction, civil engineering, architecture, and engineering. One of the ways that Autodesk has successfully marketed AutoCAD is through the use of templates. Templates are ready-to-use drawings that can be combined with other drawings to create more complicated drawings. However, to create and then use a template, you must first design it, complete it, and then send it to Autodesk for licensing. In this review, we have focused on the new features that AutoCAD has introduced, the new template functionality, the cloud features that make AutoCAD better and easier to use, the mobile and web version of the software, and the hardware support. Keyboard Shortcuts That Lead to Better Workflows When you launch AutoCAD, you are presented with a shortcut menu that provides a variety of keyboard shortcuts that can be configured to your liking. For example, to select or deselect multiple objects, you can press Ctrl+A and then the number of objects you wish to select. To select or deselect a portion of an object, you can use Ctrl+Shift+A and then the amount of the object that you wish to select. The keyboard shortcuts can be used at different times during the design process, especially when you are ready to submit your design to the printers or send the design to a 3D modeler to be turned into a solid model. The following screenshot shows the shortcut menu that you see when you launch AutoCAD and the shortcuts that are available from this menu: When you first open a drawing in AutoCAD, the shortcut menu is available by right-clicking any object in the drawing canvas. The shortcut menu also appears when you right-click the title bar of any drawing window. Most of the shortcuts that are listed in the shortcut menu are not always necessary in your workflow. However, there are some that do come in handy from time

AutoCAD supports interoperability with other computer programs and applications, using its APIs. There are two interfaces, which allow for seamless integration into other programs and applications. These are the graphic communication subsystem (GCS) and the workstation subsystem (WSS). Some of the most widely used programs which use AutoCAD: Elevation software: plans and elevations for construction sites, architectural design. CAD drafting Database application: database management system (DBMS) Desktop navigation: Desktop Navigation Image processing: image processing and digital photography Music: music software for audio analysis and mixing Online map database: geospatial information Simulation software: creates and modifies a simulation of a three-dimensional construction project References External links Autodesk Autodesk Exchange Apps Category:AutoCAD Category:Computer-related introductions in 1982 Category:1987 softwareQ: How to create RESTful ASP.NET Web API with Identity Server We are building a Web API that will provide authorization to various applications, including Angular applications and mobile apps. I have looked into Identity Server, Identity Server 4, and the ASP.NET Core Identity approach. I would like to know: What is the most appropriate approach for building a Web API that uses Identity Server? What is the best approach to create a separate front end in Angular (with a shared library and services for authorization) that communicates to the Web API? How do I handle the problem of MVC controllers (most notably Controller and ApiController) and Identity Server-provided services (e.g. Validation, Logging, etc.) A: Identity Server 4 is now a component of ASP.NET Core and can be run as a standalone application. This article explains how to do that. If you were using Identity Server 3.0 you would use the identity manager: services.AddIdentityServer(options => { options.PublicClientId = "your_client_id"; options.Authority = "" ; options.RequireHttpsMetadata = false; options.SupportedTokens = SupportedTokens.All; options.TokenStoreOptions.DefaultScopes a1d647c40b
