We performed topography-guided vascularized fibular grafting in 10 consecutive patients with complex fibular nonunions. The mean interval from injury to fibular nonunion was 15.3 months. All nonunions underwent operative treatment with vascularized fibular grafts harvested from the same leg. The mean follow-up period was 37.2 months. We harvested the fibular graft from the same leg as the fibula with which it was planned to achieve nonunion healing. The length of the graft was measured, and a graft with a mean length of 5 cm was needed in nine patients, but in one patient the graft length was 14.5 cm, which was not sufficient for arthrodesis. The mean time from injury to fibular nonunion to operation was 28.3 months. Nine patients showed excellent and excellent-to-good bony union, and one patient showed fair union. There was no morbidity in the donor leg and no donor site morbidity. This procedure is a relatively simple and effective surgical method for treating complex fibular nonunion.Tag: franz schmid The Green Bay Packers just can't seem to catch a break in their quest to reach the playoffs. They've been in free-fall for weeks, and even though they're currently in prime position in the NFC, it's looking more and more like they're going to miss the postseason. The only thing that could have helped them out in their divisional-rivalry game against the Chicago Bears on Sunday would have been a win. Instead, the Packers had to endure a 35-21 loss, their third straight defeat and sixth loss in their last seven games. The loss leaves them with a 5-8 record and 8th-place in the NFC North, and a 3-5 record and 12th place in the entire NFL. This, of course, means that the Packers will have to win out the rest of their games just to finish at .500 for the season. Luckily for them, they have games against the Cowboys and Lions to do just that. But for the Packers, that's the difference between a1d647c40b
